ANNEX

ANNEX 1 – DEMOGRAPHIC SURVEY FORMS

The demographic survey was conducted on a per-household basis, aiming for 100% coverage. The information collected was as follows:

General Information

Risk Area

Risk Area Code

Latitude and Longitude

Address

Name of the respondent

Whether an interview was conducted and whether the respondent lives in the house

Housing Information

Type of occupation

Number of residents

Number of families

Number of children

Number of elderly people

Number of people with disabilities

Length of residence occupancy

Type of construction

State of conservation

Level of finishing

Number of floors

Type of flooring

Type of wall

Type of roof

Structural Problems and Risks

Evidence of structural problems

Evidence of risks

Report of fatalities caused by hydrological or geological disasters

Photographs of the façade

ANNEX 2 – KNN METHODOLOGY

To impute missing values in the demographic survey, the k-Nearest Neighbors Method (kNN) was adopted — a statistical approach based on the similarity between observations. The kNN method is widely used due to its flexibility and effectiveness in preserving the local structure of data, making it suitable for both statistical and machine learning contexts (SUN et al., 2018; MORETTIN & SINGER, 2022).

In the present study, kNN imputation was carried out using as predictor variables the characteristics of dwellings recorded in the demographic mapping dataset of the study areas.

The kNN algorithm operates under the principle that similar observations share close characteristics in a multidimensional space. Imputation occurs by identifying the k nearest neighbors of an observation with a missing value and calculating similarity based on distance metrics, such as the Euclidean distance. This approach is particularly useful when missing data do not follow a systematic pattern — such as irregular sampling or collection inconsistencies — because the algorithm adapts to local variability, integrating multiple representative factors of the phenomenon under analysis (BUELENS et al., 2018).

In the specific context of this study — focused on risk areas — the concept of “neighbors” refers to the statistical meaning used in the kNN method, where a neighbor is defined as the sample element closest to the point to be inferred. It is important to note that a kNN “neighbor” does not necessarily correspond to immediate geographical proximity, although sample elements from the same sector tend to exhibit higher similarity.

Population projection was determined based on sociodemographic variables describing the household characteristics, as detailed below.

Since kNN is a similarity-based algorithm that defines the value of an observation based on data from its k nearest neighbors, the choice of the parameter k — the number of neighbors considered — is crucial for model performance (SUN et al., 2018; MORETTIN & SINGER, 2022).

Very low k values can generate unstable estimates sensitive to noise, while very high k values may dilute local relationships, introducing bias and compromising inference precision.

To identify the optimal k value, a cross-validation procedure was implemented — a robust and widely used method in machine learning. This process divided the dataset into multiple training and testing subsets, enabling iterative evaluation of kNN performance for different k values and selection of the most appropriate parameter.

Within the PMRR population survey, kNN was parameterized using preselected variables representing the socioeconomic and physical profile of each sampled sector:

Total population of the sector (source: IBGE): macro indicator of population density

Average residents per household in the sector (source: IBGE): reflects the household occupation profile.

Risk degree (R1, R2, R3, R4): standardized classification of vulnerability levels.

Type of risk (e.g., flooding, erosion, landslide): categorical specification distinguishing risk dynamics.

The primary objective of this study was the conservative imputation of missing data for four household variables: number of residents, number of children, number of elderly people, and number of people with disabilities (PWDs). These variables were considered essential because they reflect both demographic structure and population vulnerability.

Application

The methodology and visualized results were developed using the R programming language (R Core Team, 2024), version 4.4.0 — an open-source tool widely recognized in the statistical and data science community. The process was structured with the support of the following packages: dplyr (v1.1.4) and ggplot2 (v3.5.1) for data manipulation and visualization tidymodels (v1.2.0) for model construction and validation. All random processes were controlled by setting the seed to 1984, ensuring reproducibility.

Initially, data collected through field interviews in the study areas were integrated with IBGE information, such as population estimates and average residents per sector, to build a representative dataset that accurately reflected the demographic and spatial characteristics of each sector.

Next, categorical variables — particularly those related to risk type and degree — underwent preprocessing via one-hot encoding, converting categories into binary numerical vectors so that similarity calculations could be made consistently across mixed data types.

To account for differences in variable scales and magnitudes, all numerical variables were normalized using the Min-Max method, adjusting values to a uniform 0–1 range. This ensured that no variable exerted disproportionate weight due to its scale, which is critical for similarity-based algorithms like kNN.

Normalization preserved the integrity of inter-variable relationships and ensured equitable contribution to the analysis.

Model Optimization

A cross-validation process was applied to optimize the k hyperparameter and prevent overfitting, assessing model generalization under different configurations.

Five-fold cross-validation was performed — dividing the dataset into five approximately equal subsets. Each subset served as the test set once, while the others were used for training. Seven k values were tested: 5, 10, 15, 20, 25, 30, and 35. This configuration balanced granularity (lower k) and coverage (higher k), ensuring both local precision and generalization. The performance metric used was Root Mean Square Error (RMSE) — preferred for its sensitivity to large discrepancies between predicted and observed values. Unlike the Mean Absolute Error (MAE), RMSE penalizes larger errors more strongly, making it appropriate for this analysis.

Table 1 – Cross-validation summarized results

Neighbors (k)	Mean RMSE	Standard Error
5	1.93	0.023
10	1.81	0.0206
15	1.76	0.021
20	1.73	0.0243
25	1.72	0.0231
30	1.72	0.0249
35	1.71	0.0233

Based on the results, $k = 20, 25,$ and 35 were selected for detailed analysis. Although the lowest average RMSE occurred at $k = 20$, this configuration also yielded the most consistent and conservative results for total resident imputation. Higher k values ($25, 35$) overly smoothed imputations, while $k = 20$ balanced local sensitivity and generalization. Thus, $k = 20$ was selected as the optimal hyperparameter, ensuring accurate and consistent imputations aligned with the sampled data.

Imputation Process

With the optimized model, kNN regression was applied to infer missing values for the number of residents per household. Since the variable is discrete, results were standardized via rounding based on percentile distribution:

Values \geq 90th percentile were rounded upward

Values below 90th percentile followed conventional rounding

This dual rule aimed to:

- Ensure greater agreement between imputed and observed data

- Adopt a conservative stance in dense or atypical areas, compensating for potential underestimations

The imputed resident counts were then used as input variables for the subsequent modeling of children, elderly people, and persons with disabilities (PWDs), following the same kNN methodology to maintain consistency.

Results and Discussion

The evaluation of the results obtained by the kNN model was carried out through a comparative analysis of the distributions before and after missing value imputation.

This procedure aimed to ensure that the distributions of imputed variables remained consistent with the patterns originally observed in the collected data, minimizing potential distortions introduced by the model. Additionally, the analysis sought to confirm that the imputed data were plausible and compatible with the nature of the studied variables.

Descriptive metrics — such as means, medians, dispersion measures, and percentiles — were used to compare variables before and after imputation. Complementary histograms were also produced to verify whether the shapes of imputed data distributions reflected expected behavior based on observed reality.

Number of Residents per Household

Initially, as shown in Table 2, the collected data displayed a relatively balanced distribution among the categories of 1 to 3 residents per household, with each representing around 23% of cases. Conversely, categories with 4 or more residents exhibited a gradual reduction in frequency, reaching the lowest proportion in the “more than 5 residents” category.

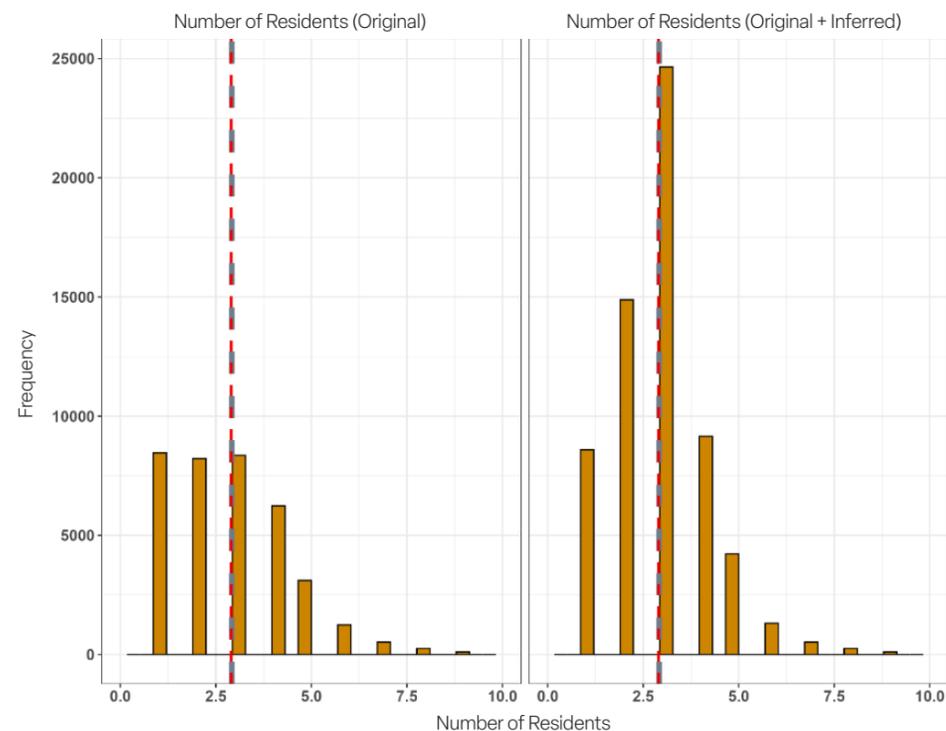

After applying the kNN model and imputing missing values (Table 3), a significant redistribution was observed. There was a marked increase in the proportion of households with 3 residents, now representing 38.62% of all cases. This redistribution highlights the model’s tendency to concentrate values around predominant categories — likely associated with data density and the algorithm’s smoothing effect.

Table 2 – Distribution of Residents per Household (Before Model Application)

Number of Residents	Frequency	Relative Frequency
1	8459	23.09%
2	8220	22.43%
3	8356	22.81%
4	6236	17.02%
5	3109	8.49%
More than 5	2261	6.17%

Table 3 - Distribution of the number of residents per household after model implementation

Number of Residents	Frequency	Relative Frequency
1	8590	13.46%
2	14881	23.32%
3	24646	38.62%
4	9155	14.34%
5	4221	6.61%
More than 5	2329	3.65%

Figure 1 – Comparison of Resident Distribution: Before and After Inference

Statistically, Table 4 shows that both the mean and median remained almost unchanged (2.90 before and 2.92 after), confirming that central data tendencies were preserved. However, the standard deviation decreased from 1.68 to 1.36, indicating a smoothing effect and reduced variability.

Table 4 – Descriptive Statistics (Residents per Household)

Measure	Original	Original + Inferred
Mean	2.90	2.92
Standard Deviation	1.68	1.36
Minimum	1	1
P5	1	1
Q1	2	2
Median	3	3
Q3	4	3
P95	6	5
Maximum	32	32

Overall, imputation was balanced and not limited to mean-centered adjustments. Less frequent categories (e.g., 4+ residents) also increased in absolute frequency, reflecting kNN's ability to integrate information from nearby observations while preserving overall structure and avoiding underrepresentation of rare categories.

Number of Children per Household

Before imputation, data indicated that 60.6% of households had no children (Table 5). Proportions decreased gradually for one child (20.8%), two children (11.9%), and more than two children (6.63%).

After imputation (Table 6), a redistribution occurred, increasing households with at least one child: 56.19% with none, 30.91% with one, 8.66% with two, and 4.24% with more than two children. This reflects kNN's smoothing behavior, which expands representation of less frequent categories while maintaining demographic realism.

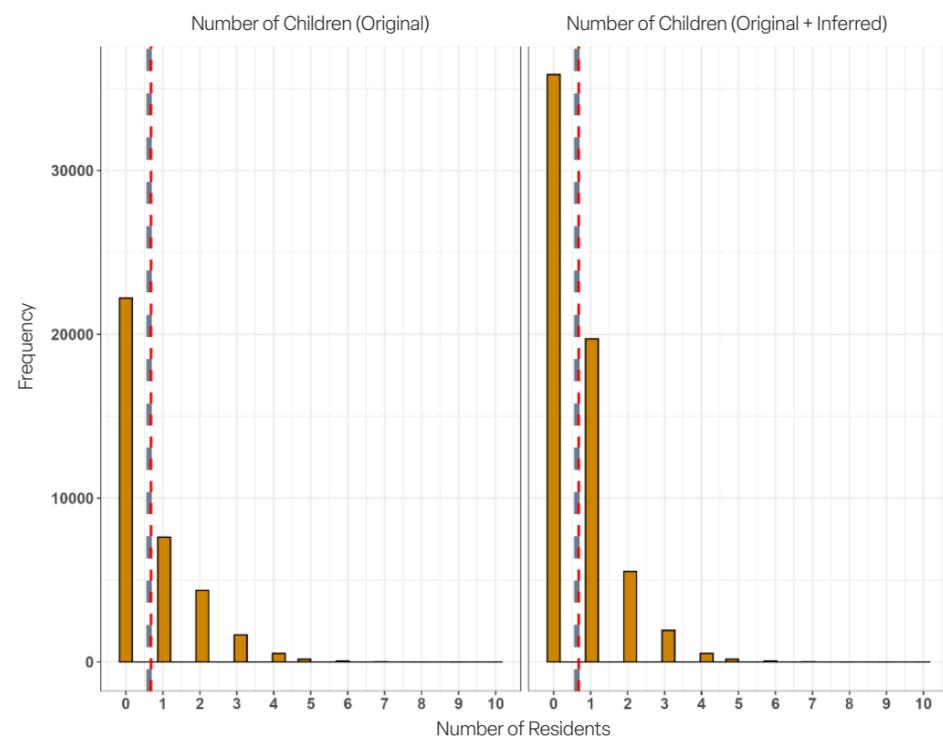

Table 5 - Children per Household (Before Model Application)

Children	Frequency	Relative Frequency
0	22218	60.6%
1	7622	20.8%
2	4372	11.90%
More than 2	2429	6.63%

Table 6 - Children per Household (After Model Application)

Children	Frequency	Relative Frequency
0	35864	56.19%
1	19727	30.91%
2	5528	8.66%
More than 2	2703	4.24%

Figure 2 – Comparison of Children Distribution: before and After Inference

The mean number of children decreased slightly from 0.68 to 0.63, and the standard deviation dropped from 1.04 to 0.89, indicating smoother variability (Table 7).

Table 7 - Descriptive Statistics (Children per Household)

Measure	Original	Original + Inferred
Mean	0.68	0.63
Standard Deviation	1.04	0.89
Minimum	0	0
P5	0	0
Q1	0	0
Median	0	0
Q3	1	1
P95	3	2
Maximum	10	10

The model indicated a notable increase in households without children (+13,646), offset by proportional redistributions across the other categories, particularly those with one child – consistent with the observed predominance up to the third quartile.

Number of Elderly Residents per Household

Initially (Table 8), 84.3% of households had no elderly residents, 11.7% had one, 3.82% had two, and only 0.145% had more than two.

After imputation (Table 9), households without elderly residents rose slightly to 86.17%; those with one decreased marginally to 11.55%, and the “more than two” category dropped slightly to 0.08%.

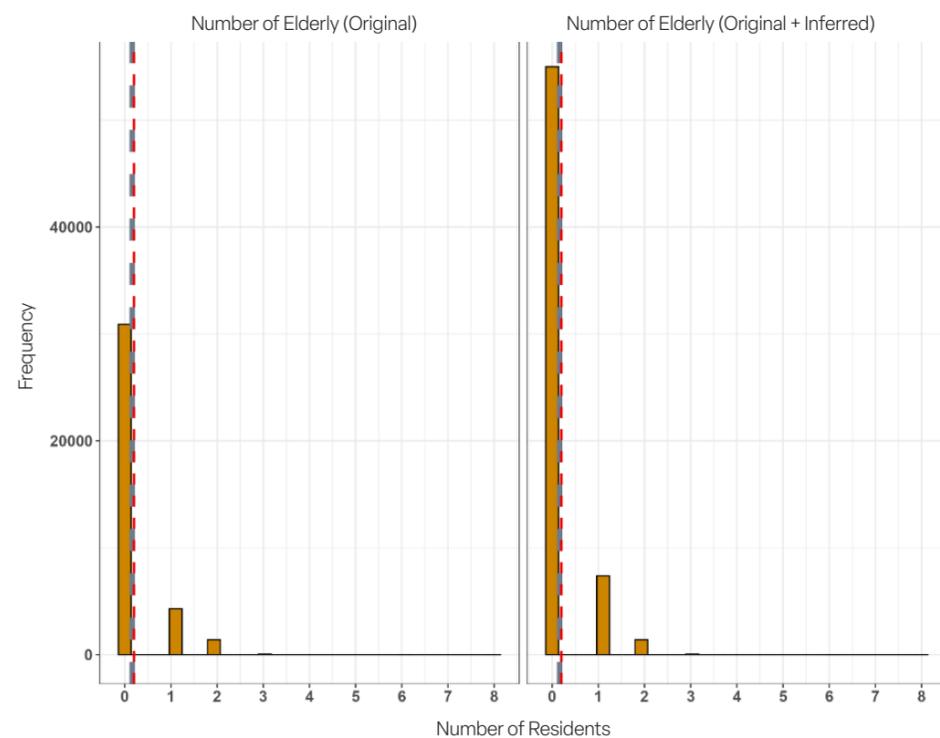

These small shifts confirm the coherence of inferred distributions, preserving global consistency with observed patterns.

Table 8 - Elderly Residents per Household (Before Model Application)

Elderly Residents	Frequency	Relative Frequency
0	30898	84.3%
1	4291	11.7%
2	1399	3.82%
More than 2	53	0.145%

Table 9 - Elderly Residents per Household (After Model Application)

Elderly Residents	Frequency	Relative Frequency
0	54997	86.17%
1	7373	11.55%
2	1399	2.19%
More than 2	53	0.08%

Figure 3 – Comparison of Elderly Distribution: Before and After Inference

Statistical summaries (Table 10) confirm preservation of central tendencies. The mean decreased slightly from 0.20 to 0.16, and standard deviation from 0.50 to 0.43, suggesting greater homogeneity and no introduction of outliers.

Table 10 - Descriptive Statistics (Elderly Residents per Household)

Measure	Original	Original + Inferred
Mean	0.2	0.16
Standard Deviation	0.5	0.43
Minimum	0	0
P5	0	0
Q1	0	0
Median	0	0
Q3	0	0
P95	1	1
Maximum	8	8

People with Disabilities (PWDs) per Household

Comparing proportions before and after imputation revealed a reduction in households without PWDs, from 95.8% to 92.86%, and an increase in those with one PWD, from 3.92% to 6.98%. Households with more than one PWD remained nearly stable (Table 11 and 12).

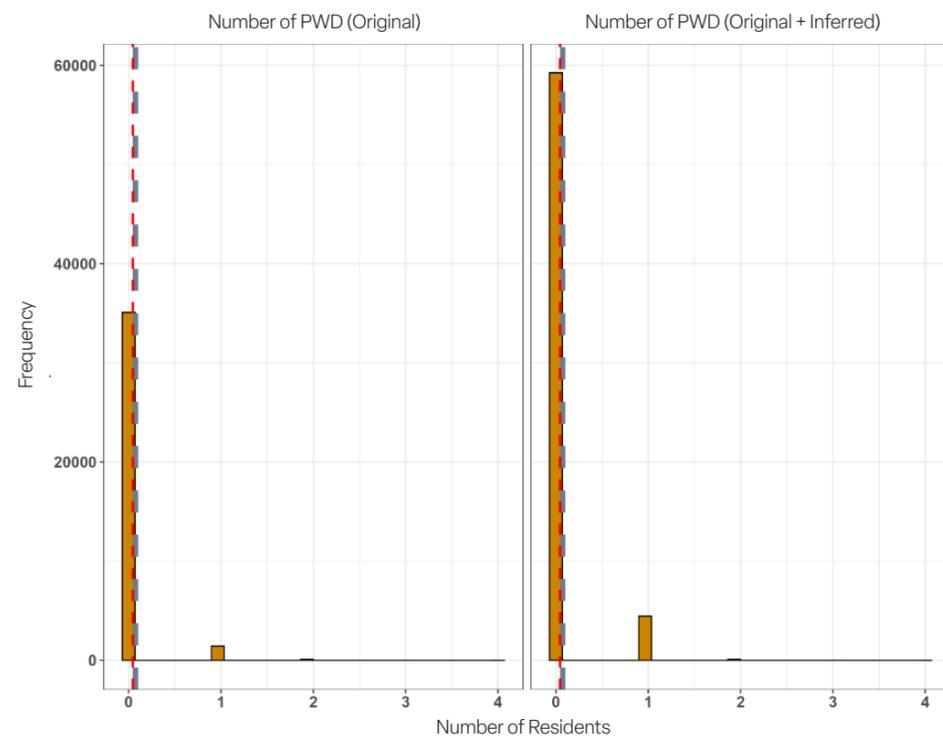

These results demonstrate conservative imputation — avoiding extreme deviations while maintaining demographic consistency.

Table 11 - PWDs per Household (Before Model Application)

PWDs	Frequency	Relative Frequency
0	35101	95.8%
1	1436	3.92%
More than 1	104	0.284%

Table 12 - PWDs per Household (After Model Application)

PWDs	Frequency	Relative Frequency
0	59263	92.86%
1	4455	6.98%
More than 1	104	0.163%

Figure 4 – Comparison of PWD Distribution: Before and After Inference

Descriptive metrics (Table 13) indicate a slight increase in both mean and variability: mean rose from 0.05 to 0.07, and standard deviation from 0.22 to 0.27. These shifts reflect carefully applied imputation that expanded representativeness without altering original structure.

Table 13 - Descriptive Statistics (PWDs per Household)

Measure	Original	Original + Inferred
Mean	0.05	0.07
Standard Deviation	0.22	0.27
Minimum	0	0
P5	0	0
Q1	0	0
Median	0	0
Q3	0	0
P95	0	1
Maximum	4	4

Conclusion

The use of the kNN method for data imputation proved effective in addressing missing demographic data. The optimization of the k parameter via cross-validation ensured model adjustment to dataset characteristics, minimizing mean square error and delivering consistent results.

The analyses confirmed that imputed values aligned with observed distributions, preserving structure and variability. The method also demonstrated conservative behavior, prioritizing reliability — especially relevant in contexts involving social vulnerability and risk.

Finally, the redistribution of imputed values was consistent with the tendencies observed in original data, showing that the model did not underestimate relevant information. Although the approach was successful, imputations remain estimates; thus, further field investigations are recommended, particularly in critical areas or where data collection was limited.

The method contributes to a broader understanding of demographic characteristics and supports public policy and risk management decisions aimed at protecting vulnerable communities.

ANNEX 5 – EXISTING PROJECTS/ ACTIVITIES IN THE MUNICIPAL BUDGET OF SÃO PAULO RELATED TO RISK AREAS

The tables below show the main expenditure forecasts directly or indirectly related to Risk Reduction in the City of São Paulo:

Agency: 1100 – Municipal Government Secretariat

Source Code: 00

PROJECT/ACTIVITY CODE	PROGRAMMED APPLICATION
11.20.04.121.3024.2470	Actions for Planning, Monitoring and Evaluation of Public Policies
11.20.08.244.3023.4884	Reencounter Program
11.20.15.451.3022.5540	Qualification and Urban Transformation – AIU-SCE – Law 17.844/2022
11.60.04.122.3024.1050	Promotion of Public Policies Funded by Federal and State Resources
11.60.04.122.3024.2239	Actions Aimed at Public Policy Development

Agency: 12.00 – Municipal Subprefectures Secretariat

Source Code: 00

PROJETO	PROGRAMMED APPLICATION
12.10.15.451.3022.1170	Intervention, Urbanization and Neighborhood Improvement – Subprefectures' Works Plan
12.10.15.452.3005.1706	Implementation and Construction of Ecopoints
12.10.15.452.3005.1708	Implementation of Composting Yards
12.10.15.452.3005.2386	Maintenance and Operation of Squares, Central Medians and Remaining Areas
12.10.15.452.3005.2705	Maintenance and Operation of Green Areas and Tree Vegetation
12.10.15.452.3005.6009	Collection, Transport, Treatment and Final Disposal of Inert Solid Waste
12.10.15.452.3005.6007	Urban Cleaning Services – Sweeping and Washing of Public Areas
12.10.15.452.3006.1169	Renovation and Accessibility of Public Sidewalks
12.10.15.452.3022.1137	Paving and Road Resurfacing
12.10.15.452.3022.2339	Maintenance and Operation of Curbs and Gutters Services (Streets and Public Roads)
12.10.15.452.3022.2340	Pothole Repair Operations

12.10.15.452.3022.2341	Maintenance of Streets and Public Areas
12.10.15.543.3022.1193	Works and Services in Geological Risk Areas – Preventive
12.10.15.541.3005.2324	Demolition and Removal of Irregular Constructions in Environmental Protection Areas
12.10.15.543.3022.1194	Works and Services in Geological Risk Areas – Emergency
12.10.17.512.3008.2367	Maintenance of Drainage Systems

Agency: 14.00 – Municipal Housing Department

Source Code: 00

PROJECT/ACTIVITY CODE	PROGRAMMED APPLICATION
14.10.16.451.3002.3357	Slum Urbanization
14.10.16.451.3002.9207	E2358 – Urbanized Lot Program, as provided by Law 17.474/20, through the Implementation of Basic Infrastructure, Sewer Network, Power Network, Rainwater Drainage System, Curbs, Gutters, and Paving
14.10.16.482.3002.3340	“Pode Entrar” Program
14.10.16.482.3002.3354	Construction of Housing Units
14.10.16.482.3002.3356	Land Regularization
14.10.16.482.3002.8060	E1964 – “Morar Melhor” Program: resources for the implementation of the “Morar Melhor” Program (Bill 731/21, approved on second discussion)
14.10.16.482.3005.3355	Execution of the Watershed Program

Agency: 20.00 – Municipal Secretariat for Mobility and Traffic

Source Code: 00

PROJECT/ACTIVITY CODE	PROGRAMMED APPLICATION
20.10.15.452.3009.3757	Implementation of Urban Redesign Projects for Road Safety
20.50.26.453.3009.1800	Electrification of the Municipal Public Transport Fleet
20.50.26.453.3009.5362	Implementation of Public Waterway Transport
20.50.26.453.3009.3704	Actions for Modernization of the Transport System

Agency: 22.00 – Municipal Secretariat for Infrastructure and Works

Source Code: 00

PROJECT/ACTIVITY CODE	PROGRAMMED APPLICATION
22.10.17.451.3008.5013	Interventions in the Drainage System
22.10.26.453.3009.5105	Interventions in the Urban Mobility Area

Agency: 27.00 – Municipal Secretariat for Green and Environment**Source Code: 00**

PROJECT/ACTIVITY CODE	PROGRAMMED APPLICATION
27.10.18.541.3005.1702	Construction and Implementation of Urban and Linear Parks
27.10.18.541.3005.1703	Expansion, Renovation and Requalification of Urban and Linear Parks
27.10.18.541.3005.1704	Construction and Implementation of Conservation Units
27.10.18.541.3005.2703	Maintenance and Operation of Urban and Linear Parks
27.10.18.541.3005.6655	Promotion of Urban Afforestation
27.10.18.541.3005.6682	Maintenance and Operation of Plant Production Nurseries
27.10.18.541.3005.7127	Environmental Studies, Plans and Projects
27.10.18.543.3005.7117	Recovery of Degraded and/or Contaminated Areas
27.10.18.542.3005.6660	Environmental Supervision, Monitoring and Control

Agency: 28.00 – General Municipal Obligations**Source Code: 00**

PROJECT/ACTIVITY CODE	PROGRAMMED APPLICATION
28.38.06.182.3011.5602	Expansion, Renovation and Requalification of Fire Department Stations

ANNEX 6 – DRAFT MUNICIPAL DECREE – MANAGEMENT COUNCIL FOR THE CONTRACTING OF PROJECTS AND WORKS IN RISK AREAS

Regulates the establishment of the Management Council for the Contracting of Projects and Works in Risk Areas.

DECREE No. XXX, of XX Month XXXX

Regulates the establishment of the Management Council for the Contracting of Projects and Works in Risk Areas.

XXXXX, Mayor of the Municipality of São Paulo, by virtue of the powers granted by law,

DECREES:

Article 1

The establishment of the Management Council for the Contracting of Projects and Works in Risk Areas, coordinated by the Executive Secretariat for Planning and Priority Actions (SEPEP), is hereby regulated under the terms of this decree.

§1. The members of the Management Council shall be appointed by ordinance of the Mayor, as follows:

I – Six (6) representatives of the Public Administration, nominated by the heads of the following municipal agencies and entities:

- a) One (1) representative and one (1) alternate from SEPEP – Executive Secretariat for Planning and Priority Deliveries;
- b) One (1) representative and one (1) alternate from the Municipal Housing Secretariat;
- c) One (1) representative and one (1) alternate from the Municipal Secretariat for Urban Infrastructure and Works – SIURB;
- d) One (1) representative from the Municipal Secretariat of Subprefectures and one (1) alternate from the Subprefecture of the region corresponding to the risk area under discussion;
- e) One (1) representative and one (1) alternate from the Municipal Secretariat for the Environment and Green Areas – SVMA;
- f) One (1) representative and one (1) alternate from the Municipal Secretariat for Urbanism and Licensing – SMUL.

II – Eight (8) representatives of civil society organizations, including:

- a) Two (2) representatives and two (2) alternates from the business sector, linked to the Municipal Council of Urban Policy (CMPU), being one (1) representative and one (1) alternate from the industrial sector, and one (1) representative and one (1) alternate from the commercial sector;

b) Two (2) representatives and two (2) alternates from civil society, through the Municipal Housing Council (CMH), including at least one (1) representative and one (1) alternate from community organizations or popular associations;

c) One (1) representative and one (1) alternate from civil society, through the Municipal Council for Social Assistance (COMAS);

d) One (1) representative and one (1) alternate from the Municipal Participatory Council;

e) One (1) representative and one (1) alternate from non-governmental organizations (NGOs) related to the environmental sector;

f) One (1) representative and one (1) alternate from professional, academic, or research entities related to urban or environmental issues operating within the perimeter of the risk area under discussion.

§2. The representatives mentioned in subparagraphs “a”, “b”, “c”, “d”, “e”, and “f” of item II above shall be nominated by their respective councils, in accordance with their internal regulations.

Article 2

The duties of the Management Council shall be:

- I – To analyze the interrelated actions among various Secretariats aimed at the socioeconomic, cultural, and environmental development of risk areas;
- II – To promote dialogue and cooperation to enhance the execution of public policies, optimizing resources and actions through the exchange of knowledge among different municipal entities;
- III – To ensure that the contracts required for the proper development of projects and works are executed with efficiency and quality;
- IV – To prepare meeting agendas and corresponding minutes;
- V – To supervise and guide the proper implementation of the collegiate’s decisions.

Article 3

All civil society representatives must meet the following requirements:

- I – Be at least 18 (eighteen) years of age;
- II – Not hold any permanent or commissioned public position, nor any legislative mandate;
- III – Not be a candidate for any other position within the same Management Council;
- IV – Not be subject to the restrictions outlined in Article 1 of Decree No. 53,177, of June 4, 2012, which establishes the disqualifying circumstances for appointment, hiring, admission, designation, swearing-in, or commen-

cement of service in any public position, employment, or function, whether permanent or commissioned.

Article 4

Non-governmental organizations and professional, academic, or research entities related to urban and environmental matters that wish to participate in the Management Council must register their candidacy in accordance with the rules established in the public notice prepared by the Council's Electoral Committee.

Article 5

The Management Council shall approve its internal regulations at its first meeting, defining its work processes, meeting frequency, and decision-making procedures.

Article 6

This decree shall enter into force on the date of its publication.
